SUMMARY

Computer Science and Engineering graduate from UBT and MSc student in Data Science and Artificial Intelligence. I build full-stack applications, data pipelines and machine-learning tools with automated tests and CI. I am building Pragu, an open-source auditor that finds accessibility barriers in Android apps and measures each rule's precision. Seeking an internship or junior role.

EDUCATION

MSc in Computer Science and Engineering (Data Science and Artificial Intelligence) 10/2026 – Present
UBT – University for Business and Technology, Prishtina, Kosovo

BSc in Computer Science and Engineering 10/2023 – 10/2026
UBT – University for Business and Technology, Prishtina, Kosovo
Thesis: Code Smell Detection and Refactoring Recommendations, presented as a paper (with A. Salihu) at the 15th UBT Annual International Conference on Computer Science and Engineering, 10/2026.

PROJECTS

Pragu – Accessibility auditor for mobile apps In development · GitHub
TypeScript, Node.js, Kotlin, Android (UiAutomation, adb), React Native, Jetpack Compose, Vitest, JUnit, GitHub Actions

- Develop a Kotlin agent and Node.js CLI that read what TalkBack sees in any Android app over adb, without changing the app.
- Implement WCAG 2.2 rules (unlabelled controls, images and fields, hidden or stateless controls, text contrast measured from screenshot pixels, touch-target size) on a platform-neutral model.
- Measure each rule's precision and recall on Pragu Bench (labelled screens from React Native and Jetpack Compose test apps); CI re-scores every rule on each pull request and fails on any change.
- Generate an offline HTML report that pins each barrier on the screenshot, with who it affects and the fix for each framework.

Planned: more rules, a GitHub Action with SARIF and pull-request comments, user-flow crawling, iOS support.

Gjurmë – News-coverage platform for Albanian-language media Live · gjurm.vercel.app · GitHub
Python, FastAPI, SQLAlchemy, PostgreSQL, Claude API, React, TypeScript, Docker, GitHub Actions, Vercel

- Built a pipeline that collects RSS feeds from 19 outlets in Kosovo, Albania and North Macedonia, removes duplicates in four layers and groups reports of the same event into stories with TF-IDF clustering tuned for Albanian.
- Added LLM tagging with Claude: schema-validated JSON, a check that drops names not in the source, and a daily cost cap.
- Benchmarked a year of synthetic data (365,000 articles); index and query fixes made entity queries up to 4.5× faster.
- Wrote 500+ tests (pytest on real PostgreSQL, Vitest, Playwright with axe), run in CI with strict typing and security scans.

CineTaste – Movie and TV recommender that explains every pick Live · cinetaste-rho.vercel.app · GitHub
Python, FastAPI, SQLAlchemy, PostgreSQL, pgvector, Redis, React, TypeScript, Playwright, Docker

- Designed a content-based ranker that combines interpretable taste features with 384-dimension vectors searched in pgvector (HNSW), then diversifies the slate, so every pick comes with a reason the user can check.
- Built an offline evaluation on held-out MovieLens ratings; reweighting the ranker raised hit rate@20 from 0.155 to 0.254.
- Implemented secure sign-in (short-lived JWTs, rotating refresh tokens in httpOnly cookies, email verification, rate limiting) and 350+ automated tests, including Playwright and axe checks.

JavaSmell – Code smell detection and safe refactoring for Java BSc thesis · GitHub
Python, scikit-learn, tree-sitter, FastAPI, React, TypeScript, Docker, GitHub Actions

- Trained random-forest and gradient-boosting models on 26 code metrics that beat published detection rules on 4,534 expert-labelled samples from 512 Java repositories (MCC 0.49–0.72 vs 0.23–0.58).
- Built AST refactorings (Guard Clauses, Extract Method, Introduce Parameter Object) offered only if they compile with javac.
- Released it as a multi-arch Docker image, a CLI that writes reviewable git patches, and a GitHub Action with SARIF output.

SKILLS

Programming languages: Python, TypeScript, JavaScript, Kotlin, SQL, HTML, CSS
Frontend: React, Vite, TanStack Query, Zustand, React Router, Tailwind CSS, Recharts
Backend: FastAPI, Node.js, SQLAlchemy, Alembic, Pydantic, REST APIs, JWT authentication
Mobile: Android (Kotlin, Jetpack Compose, UiAutomation, adb), React Native (Expo), TalkBack
Data & AI: scikit-learn, NumPy, pgvector, recommender systems, TF-IDF clustering, LLM APIs (Claude), model evaluation
Databases: PostgreSQL, Redis
Tools & DevOps: Git, GitHub Actions, Docker, Gradle, pytest, Vitest, Playwright, axe-core, JUnit, Vercel, Render, Neon
Concepts: layered architecture, CI/CD, automated testing, architecture decision records, query optimisation, accessibility (WCAG 2.2)

LANGUAGES

Albanian (native) · English (B1–B2) · Serbian (B1)
